

Beehive, Secure Internet File Transfer and Workflow

Prepress, Reprographics, Medical, Manufacturing, Banking and Marketing operations, moving large files as part of their business, need Beehive to shorten production cycles and to reduce Air Courier expenses.

Beehive Secure File Transfer Workflow By the Numbers:

1 - Customer sites can send files and folders directly to remote production facilities using either the Beehive Macintosh or Windows secure desktop client with the "Simple as 1-2-3" procedure: 1) Drag files onto Beehive icon, 2) fill out the html form that pops open, and 3) click Send. The files are compressed "on-the-fly". Destination addressing may either be done with email addresses or via predefined, logically-named encrypted keys e.g. "Uptown Printing".

2 - Customer Sites can send files and folders directly to remote production facilities using the Beehive/Sendfile.net browser client. When the customer launches the special Beehive URL, an industrial strength JAVA applet is loaded into their browser. They attach the files they want to send, fill out the form and click send. The files are auto-compressed "on-the-fly". Destination addressing may either be done with email addresses or via predefined, logically-named encrypted keys.

3 - All Beehive clients, Mac, Windows and Browser use the same forms, destination site keys and splash images. Whether you are using the hosted service or you have your own appliance, each client will update against the designated Beehive Appliance at startup and receive the latest forms, and site updates. Add as many forms as you want.

4 - There are 3 types of communication between a client and the Beehive appliance :

a) File Transfer - When Clients are sending directly to a Beehive appliance at your facility, they are transmitting files using the secure HTTPS protocol. This protocol is suitable for HIPAA, DOD and other secure transfer environments. This secure protocol is not available in hosted mode, which uses encrypted-key FTP.

b) Service Update Protocol - All Beehive clients (Mac/Win/Browser) automatically update forms, keys and splash images against the server on startup.

c) Email Receipts - the Appliance returns email receipts upon receipt of files.

5 - The Beehive File manager performs all of the automated back-end operations on received files. The File Manager decompresses the received files and moves them along with the form to a "Jobsin" folder of your choosing. The Beehive File Manager may be run directly on the Appliance or it may be run on separate Macintosh or Windows machines in Hosted mode.

6 - When the File Manager downloads the files it can send email receipts to the originator confirming receipt. The Beehive File Manager can also send email notifications to the administrator or production workers.

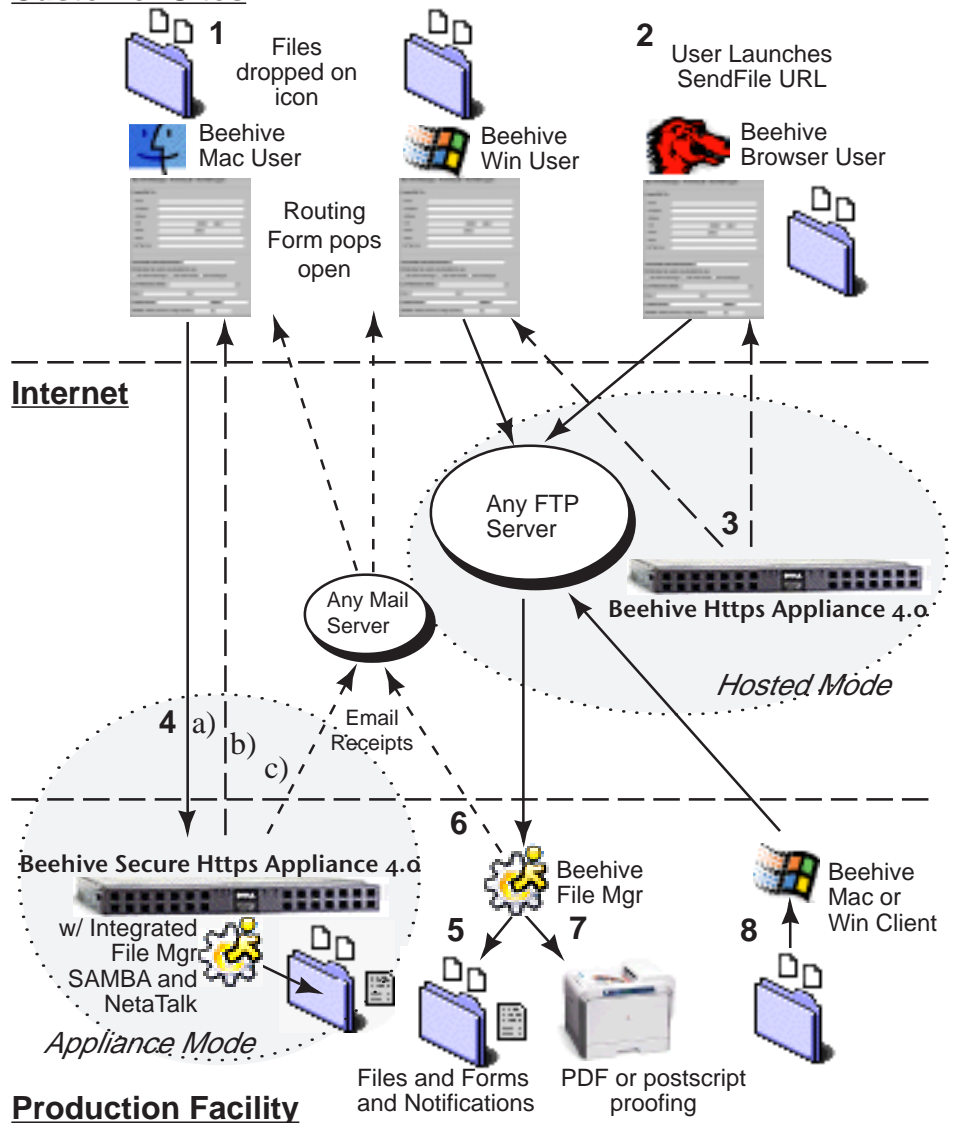

7 - The Beehive file manager can redirect received Postscript or PDF files directly to output on selected proofing devices from Xerox and other vendors.

8 - Production facilities often have to send PDF proofs, scanned images, fonts and utility files back to Customer sites. The Beehive client allows any user in the system to be a sender using Simple as 1-2-3 drag and drop sending. As always, jobs can be email addressed or sent to predefined logical locations. When email addressing a job to an individual, a notification email is sent to the recipient, with a URL and instructions for file retrieval. The recipient clicks on the URL in the message and his browser is launched with the BEEMAIL Java Applet loaded. The files are downloaded to the user's computer and are streaming decompressed "on the fly".

Your Choice of Hosted Mode or Appliance on Your Site

The powerful Beehive/Sendfile Workflow system is available in *Appliance* mode (you run the system at your site) or in *Hosted* mode (you share one of the Beehive Internet Hosted Appliances). The *Appliance* mode uses the Beehive Secure HTTPS file transfer server while the *Hosted* mode uses the FTP storage space of your own choosing. In either case you receive an unlimited client software distribution license and the use of the Beehive File Manager for processing received jobs.

Customer Sites

Beehive Turnkey Setups get your File Transfer System up and running quickly. Installation, Configuration and on-going support all included in the price!

Turnkey Installation and Support Starting with The "How to Send us Files Page" we put on your web site.

- 1 - We create a custom Beehive Macintosh client and add it here. We add your logo, custom form and encrypted site key.
- 2 - We add your custom Beehive Windows client here.
- 3 - SendFile.NET is our browser-based JAVA applet with NO application to download! It's perfect for people who don't want to install the desktop client. With Sendfile you may also send files and proofs back to any customer that has a browser and an email address! The recipient receives an email notification with a URL and password - they click on the URL, enter the password and an inbox appears with the files to download.

How to Send us Files

To transfer files to us via the Internet - use the Beehive file transfer software below. This software makes an HTTPS connection across the Internet and quickly transfers the files to our server. As soon as the files are confirmed received, you will receive a receipt in your Internet e-mail box. You have two choices - you may either download the Macintosh or Windows desktop software or you may use the Browser/Java client. The first time you use Beehive you will be prompted for user information.
